

Job Category:

Finance, Banking

Position:

Senior Business Consultant Risk Data & Modelling

Location:

Amsterdam, the Netherlands

At a glance

Do you see the importance of high quality data? Are you committed to accurately define the data requirements of Risk Management and supplying them together with various business players within the bank? Are you, like us, keen to bring risk data management to a structurally higher level? And do you have good ideas about how this should be done? If so, then the role of Senior Business Consultant Risk Data & Modelling is an interesting job for you!

The role gives you the chance to develop yourself fully, both professionally and personally. Tell us your story. We are curious!

Your job

As a Senior Business Consultant for Risk Data & Modelling, you will make a vital contribution to supplying reliable risk-related data to various stakeholders in the Risk Management organisation. You will use your knowledge and skills to work with Risk Management, the business and the IT organisation to meet the specified goals.

You will support various teams in translating the Risk stakeholder data requirements into detailed data requirements in line with the BCBS 239 principles. You will assess these requirements against the terms and definitions we use and ensure that our Finance & Risk common language remains up to date. Together with the data owners, you will supply the requested data to the relevant Risk stakeholders in accordance with the specifications and the agreed timelines. Because we are bringing the risk data management process to a structurally higher level, you and your colleagues will be actively working to improve the process where necessary. Autonomous cooperation based on an agile approach will be the key to success.

Given the importance the regulatory authorities ascribe to risk management (modelling, external reports, internal audits) and the data underpinning it, this is a challenging role with a potentially heavy workload.

Your working environment

The Risk Data & Modelling grid is part of Risk Data & Analytics (RDA) and plays an active role for all the Risk departments. We employ 80-100 staff, all of whom share a passion for getting the most out of risk data. Our aim is to generate reliable risk data in good time. We do this by improving the risk data itself, data systems and data processes.

You will work in the Value Proposition Team within the Risk Data & Modeling. The team consists of professionals with different backgrounds and driven to bring risk data management to a higher level at a structural level. Because the department is still under development, you will be expected to actively contribute to the strategy for improving the working method. The atmosphere is open and informal. We work hard, but there's plenty of room for enjoyment!

Your profile

You have proven ability in data analytics, data management, data modelling, data architecture and/or portfolio management.

You are energetic, with a passion for combining thinking and doing. You know what is going on within the organization. Client focus is the main driver behind your work within the team. You take responsibility. As well as having a strong drive to keep your own expertise up-to-date, you're keen to actively contribute to further developing and improving the field you work in. You're energised by transferring your expertise to others and are interested in what you can learn from colleagues with other expertise.

If you think this sounds like you, check to see if your profile matches the following:

- You've successfully completed a higher professional education (Bsc.) or degree (Msc.) and have at least 5 years of relevant work experience
- You are keen to broaden and deepen your knowledge of data, modelling, process and consultancy
- You have a demonstrable affinity with IT
- You embrace the agile way of working
- You are teamwork-, innovation- and goal-orientated
- You have an affinity with data, modelling and risk management
- You are data-driven and innovative
- You have the capacity to challenge your stakeholders and get to the "question behind the question"

What we offer

You will be given sufficient scope to contribute to value creation using our risk data. We're also keen to learn from your experience of data value creation and model applications. You will be given the opportunity to further deepen your expertise and/or broaden your role, from data modelling to data delivery and from portfolio to data management. There will be various growth opportunities in your area of expertise and also beyond, depending on your goals, interests and experience.

We also offer:

- the ability to work flexible hours
- a supplementary benefit budget of 11% with which you can buy flexible fringe benefits such as extra days off, a subsidy to cover the costs of a phone or an (electric) bicycle, and salary top-ups
- a personal development budget of € 1,000 per year with an option to save up to € 3,000
- an annual public transport season ticket
- a good pension scheme
- a good salary

Job Posting Date: 06-July-2020
